Mentor

Date

Notes

- You should use this template for your project proposal. There are a variety of slide types to draw from. **Do not deviate from the slides or the styles.**
- The following is a suggested set of topics that you should cover in your final presentation. Feel free to make your own choice on exactly how you convey your project but be sure to cover the main topics (objectives, research questions, data, approach key findings etc).
- You will have no more than 15 (TBC) minutes to present, which probably means you will need approximately 10-15 slides.

Purpose of Presentation

- Bear in mind that the purpose of your presentation is to act as a type of '**advertisement**' or 'teaser' for your project report. You should be able to 'sell' your work to the class at an intellectual level.
- It should provide enough information to convince people that you have produced a project that is worth finding out more about.
- It is not a dumping ground for everything you did and every result you found, nor is it appropriate to just give the superficial highlights.
- Your job is to use it to focus on the important aspects of the project, without trivializing or exaggerating your work.

Motivations & Objectives

- A bullet list of the main motivations and objectives of this work.
- Keep these reasonably high-level and concise, but informative.
- Why did you do this research project and what did you hope to find out as a result?

Related Work

- Summarise any related work that you believe applies to your project.
- Has the topic been looked at before? If so by who, when, and what did they show.
- What makes your project distinctive?

Research Questions

- Enumerate the main research questions that you set out to answer, indicating who was responsible for what question.
- These research questions should be specific and testable. You should be able to articulate each one in a single sentence. Try to avoid the temptation to enumerate a long list of simple questions. Focus on the main ones!

Datasets and Data Collection

- Briefly summarise the datasets you used, where you got them, and how you cleaned them.
- If there was some aspect of the data collection that was particularly challenging, then feel free to discuss; for example, if you had to scrape your data or use an API then mention this.

Key Findings

- Use one slide (or more if you really must, but only if you must) to summarise the results of each RQ,
- Each slide should clearly articulate the question and the approach and include an appropriate graph.
- You should be able to justify why the finding answers the question you say it answers.
- If you were surprised by a result? If so, then highlight this.
- Can you explain why your found a particular result? What does it mean to you.

Discussion

- You can include some final slides to highlight other issues that you came across such as ethics, reproducibility, data quality etc.

Conclusions

- Briefly summarise the main conclusions of your project. What did you find? What did you not find, but expected to find?
- Who will benefit from your work and why?
- What are the limitations of what you have done and what you would prioritise as future work?

Common Mistakes

- Poorly prepared slides that are little more than a “brain dump” of text with spelling errors etc.
- Slides that are not legible (fonts too small etc)
- Graphs that are too small, difficult to read, inconsistently presented, poorly annotated.
- Poor use of terminology; lack of clear definitions about what you are doing.
- Presenting results that do not actually (or fully) answer the questions you have asked ;being unable to convey the meaning/implications of your results.
- Presentations that are not well rehearsed/engaging, or that are too short or too long: you have 10 minutes, not 5 minutes or 15 minutes!
- **Do not read from your slides**. Speak loudly and clearly, and in compete sentences.
- Trying to cram too much in. Focus on your main findings only.
